Desiccated Coconut

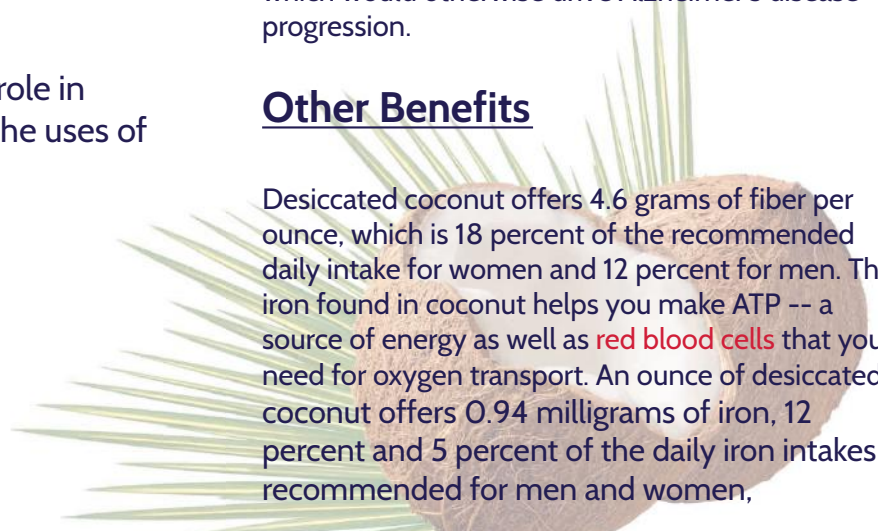

Connective Tissue Strength

Desiccated coconut provides minerals you need to keep your connective tissues, a group of tissues that includes your **skin, tendons, ligaments, bones and teeth strong**. Connective tissue contains large amounts of collagen, tough and resilient protein fibers that form networks and hold your tissue together. Both copper and manganese support healthy collagen production, so they keep your tissues strong.

Support for Brain Function

The copper in desiccated coconut also maintains the health of your brain. It activates enzymes responsible for the production of **neurotransmitters chemicals** your brain cells use to relay information. Other copper-dependent enzymes help you produce myelin, the fatty coating that sheaths each nerve cell and helps the cell conduct electricity. The fat found in desiccated coconut might also prevent neurological disorders. One study, published in the "Journal of Alzheimer's Disease" in October 2013, found that the oil in coconut helps shield nerve cells from the toxic effects of protein plaques, which would otherwise drive Alzheimer's disease progression.

Other Benefits

Desiccated coconut offers 4.6 grams of fiber per ounce, which is 18 percent of the recommended daily intake for women and 12 percent for men. The iron found in coconut helps you make ATP -- a source of energy as well as **red blood cells** that you need for oxygen transport. An ounce of desiccated coconut offers 0.94 milligrams of iron, 12 percent and 5 percent of the daily iron intakes recommended for men and women,
